Solutions for Point of Care Ultrasound

HOW ORPHEUS SOLVES POCUS WORKFLOW
TOMER BEN-SIRA
VP MARKETING AND BUSINESS DEVELOPMENT
Point of Care Ultrasound (POCUS) is ultrasonography brought to the patient and performed by the provider in real time. Point-of-care ultrasound images can be obtained immediately, and the clinician can use real-time dynamic images (rather than images recorded by a sonographer and interpreted later), allowing findings to be directly correlated with the patient’s symptoms. It is used in various specialties and usually divided into three main areas of applications: procedural, diagnostic, and screening.

<table>
<thead>

**POCUS Live Workflow**

The POCUS workflow demands the ability to provide timely consultation by a specialist with minimal disruption to workflow. These ultrasound machines are portable and can be used in various departments and in unplanned circumstances (meaning, there is no order for the study).

Clinicians require a convenient way to:

1. Easily stream and capture video with hands-free controls.
2. Minimal HW footprint on the mobile ultrasound imaging modality.
3. Instant and secure access from anywhere to the video stream for immediate collaboration between sonographer and expert clinician.
4. Ability to select which streams to include in the permanent patient record and which ones to delete.

**How Orpheus Improves POCUS Workflow**

The Orpheus System combines a low footprint, state of the art device that serves as an efficient streaming and recording device. Combined with a web-enabled client application, the stream is initiated remotely by the expert.
Bi-directional collaboration begins seamlessly. The Orpheus centralized video management system provides tools for clinicians and administrators to manage the streams and recordings (store, share with PACS/VNA).

The Orpheus CAST video and image streaming and capture solution combined with the Orpheus workflow software connected to the centralized Orpheus server empowers you with an advanced POCUS live workflow.

- The Orpheus CAST is an ultrasound modality vendor neutral solution that directly connects to the raw video source.
- The Orpheus CAST automatically registers on the network and can be remotely controlled to start and stop the stream and recording session.
- The Orpheus system assigns a unique identifier (if no patient ID is available) to the session to ensure accurate documentation, easily locate the session and later associate it to the patient record.
- The system provides modality worklist for accurate and time saving patient and procedure identification.
- The Orpheus Live user interface provides the remote expert with all the tools necessary to document the session – take snapshots and bookmarks, easily associate to the patient record and share results with EMR and PACS/VNA.

### Advantages of a Centralized Approach

The advantages of a centralized clinical media management platform include:

- Instant access from anywhere, anytime for uploading images and videos and reviewing them.
- Standardized documentation and accessibility for clinical diagnostics and reporting.
- Minimal ongoing costs to capture and store thousands of videos and images.
- Secure storage, access controls and auditing that enhance patient privacy.
- Single point of integration with enterprise systems such as electronic medical record (EMR) and PACS.

### POCUS Live Workflow with Orpheus

**Step 1: Turn On Orpheus CAST**
- Sonographer turns on Orpheus CAST
- Streamer automatically registers on network and ready for stream

**Step 2: Engage Remote Physician**
- Alert physician that collaboration session is needed
- Physician logs in to Orpheus client application from any laptop or PC (same hospital credentials)

**Step 3: Start Stream**
- Physician selects the modality from a list
- Stream starts in a single click
- The session is assigned a unique identifier
- The stream is recorded on server (optional)

**Step 4: Bi-directional Collaboration**
- View live POCUS session bi-directional audio visual
- take snapshots, tag and annotate
- share with PACS/VNA

**Step 5: End Stream**
- Physician logs off from Orpheus client stops stream
- Sonographer turns off Orpheus CAST or it can shut off automatically when unplugged or after timeout

Patients in early shock who were evaluated with point-of-care ultrasound spent less time being treated with vasoactive medications. This has the effect of fewer days spent in the intensive care unit (ICU), as well as decreased morbidity. The POCUS patients spent considerably less time on vasopressor medication. There are trends toward improvement in other therapy milestones such as hours to wean off vasopressors, total hours spent on ventilators, and days in the ICU. The decreased morbidity and calculated cost savings of around $20,000 per patient from the use of point-of-care ultrasound could be very significant.
